¿Por qué Haskell?

Razonar sobre el código

Tipificado estáticamente

userExist :: Int -> Int -> Bool

userExist userId groupId = ...

```
newtype UserId = UserId Int
```

```
newtype GroupId = GroupId Int
```

```
userExist :: UserId -> GroupId -> Bool
```

```
userExist userId groupId = ...
```

Pureza

Evitar errores

```
function foo (num) {  
  if (num>10) {  
    return "JavaScript no es tan malo";  
  }  
}
```

```
function foo (num) {  
  if (num>10) {  
    return "JavaScript no es tan malo";  
  }  
}
```

```
console.log(foo(1).toUpperCase())
```

```
function foo (num) {  
  if (num < 10) {  
    return "Java è un malo"  
  }  
}
```

```
console.log(foo(1).toUpperCase())
```

Seguridad

```
data Maybe a = Just a | Nothing
```

```
foo num =
```

```
  if num > 10
```

```
    then Just "Haskell es seguro"
```

```
    else Nothing
```

```
foo :: Integer -> Maybe String
```

```
foo num =
```

```
  if num > 10
```

```
    then Just "Haskell es seguro"
```

```
    else Nothing
```

bar num =

case foo num of

Just text0 ->

String.toUpperCase text0

Nothing -> "Ouch"

bar num =

case foo num of

Just texto ->

String.toUpperCase texto

bar num =

case foo n

Just text
